Cross-Reference to a Related Application

This application claims the benefit of provisional patent application Serial No. 60/433,280, filed December 10, 2002..

Field of the Invention

10

The subject invention relates to a shoe insert, and more particularly to a golf shoe insert that is removable, adjustable to the golfer's foot size and shape, and that can confer support and stability to the golfer's foot to aid in teaching the golfer how to attain an optimal golf swing as well as to prevent and/or treat stress/injuries associated with golfing activities.

Background of Invention

20

25

In golf, one of the most important skills in the game is proper body position in executing a golf swing. To generate the optimum golf swing, the shifting of weight from the back foot to the front foot plays a key role. The actual dynamic motion of each foot during the golf swing is different when comparing the position and motion of the back foot with the position and motion of the front foot. Specifically, at club impact on the ball and follow through, the front foot during the weight shift should roll about its longitudinal axis and the body weight should be on the outside of the front foot at the end of the swing. In contrast, the back foot should remain firmly planted with the weight on the inside of the rear foot and during the initial part of the swing to allow the weight to transfer from the back foot to the front foot. Thus, the ideal golf swing requires somewhat unnatural movement of the skeletal and muscular structure in human beings. Often, a golfer must train his muscles to move in exactly the right manner to obtain a proper swing to cause the ball to be driven along a straight, intended path.
